For this project, we will require the following data:

1. Data on the 5 boroughs as well as the neighbourhoods that exist in each borough. The latitude and longitude coordinates of each neighbourhood are required as well. I will obtain this information from https://cocl.us/new_york_dataset.

2. Detailed information on Burger joints in New York City. This will be obtained from Foursquare. Foursquare will be able to provide us with detailed information of all the burger joints in New York such as location, ratings, likes, reviews, etc.

By combining and integrating both sources of information using data science tools, we will be able to obtain the information required to ssolve the business problem that was previously discussed.
